Goniometry is the measurement of joint angles. The tool you will use to measure joints is a goniometer. There are many different types of goniometers on the market, but each has essentially the same structure: two arms (one stationary and one moveable) and an axis (fulcrum) that is surrounded by the body of the goniometer, which contains a measuring scale.

The tibiofemoral joint is a double condyloid joint with 2 degrees of freedom. Flexion-extension occurs in the sagittal plane around a medial-lateral axis and rotation occurs in the transverse plane around a vertical (longitudinal) axis. 1 The incongruence and asymmetry of the tibiofemoral joint surfaces combined with muscle activity and ligamentous restraints produce an automatic rotation.
