Organic Rankine Cycle Technology All

The Organic Rankine Cycle (ORC) is named for its use of an organic, high molecular mass fluid with a liquid-vapor phase change, or boiling point, occurring at a lower temperature than the water-steam phase change. The fluid allows Rankine cycle heat recovery from lower temperature sources such as biomass combustion, industrial waste heat, geothermal heat, solar ponds etc.

One of the most promising technologies of Waste Heat to take advantage of this energy is the Organic Rankine Cycle ORC. The ORC uses an organic gas (pentane, octane, R123, etc.) as the working agent of the cycle because of its low boiling temperature ($< 80^{\circ}\text{C}$), instead that of the Rankine Steam Water Cycle of the thermal power stations.
